Ques 1- Explain the difference between Relative, Absolute and Mixed Cell Referencing.

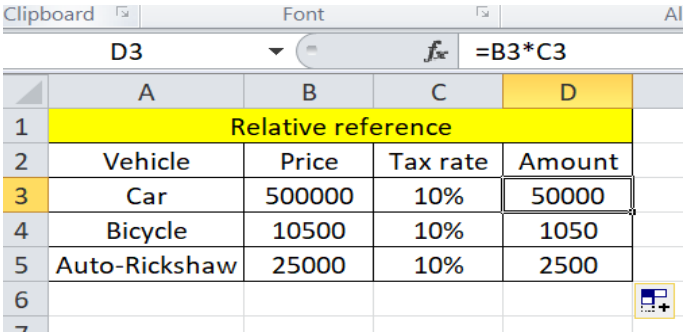
You have the following dataset:

Vehicle	Price
Car	500000
Bicycle	10500
Auto-Rickshaw	25000

Ans 1- Relative reference- Relative reference changes automatically when formula is copied in another cell.

It doesn't use $ sign.

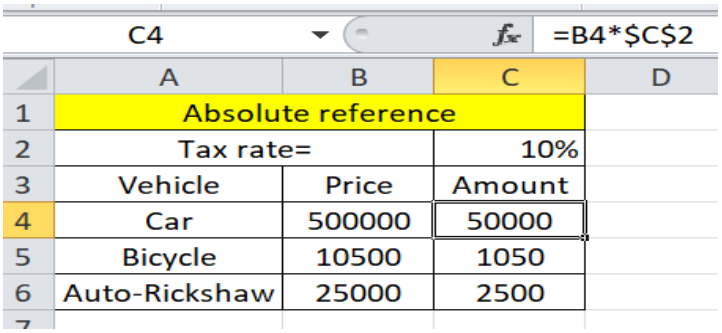
Example- Let's assume tax rate is 10% then amount is calculated =B3*C3 and then drag it in required cells.



Absolute references – It Keeps the formula constant when copied in cells.

Uses $ symbol before row and column

Example: =B4*C2



Mixed Reference- Mixed Reference fixes only row or column.

- $ will be used only with row or column
- Relative + Absolute
- Exmaple: =$B4*C$2

C4 =$B4*C$2

	A	B	C	D
1	Mixed reference			
2	Tax rate=		10%	
3	Vehicle	Price	Amount	
4	Car	500000	50000	
5	Bicycle	10500	1050	
6	Auto-Rickshaw	25000	2500	
7				

Ques2- Write a formula to calculate the total sales of Car and Bicycle only only.

Ans- Total sales is calculated using SUM function

=SUM(B11,B12) which will return the output 510500

B14 =SUM(B11,B12)

	A	B	C	D
7				
8	QUES 2			
9	total sales of Car and Bicycle only			
10	Vehicle	Price		
11	Car	500000		
12	Bicycle	10500		
13	Auto-Rickshaw	25000		
14	total sales	510500		

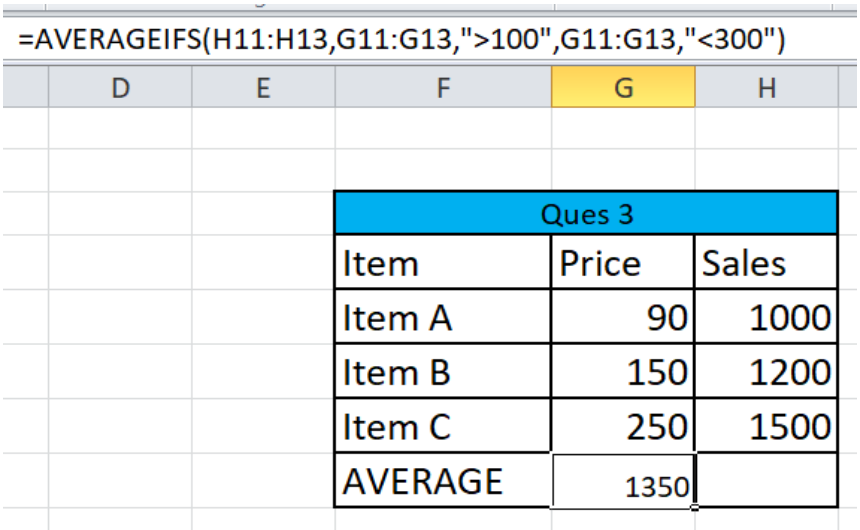
Ques3- Q3. Write a formula to calculate average sales of items priced above 100 but less than 300

Item	Price	Sales
Item A	90	1000
Item B	150	1200
Item C	250	1500

Ans3- To calculate average sales of items priced above 100 but less than 300:

=AVERAGEIFS(H12:H14,G12:G14,">100",G12:G14,"<300")

WHICH GIVES AN OUTPUT 1350



Q4,Q5,Q6,Q7,Q8 are performed in excel sheet
